

I have been an aquatic engineer for over 30 years and have been specifying the HALO Controller on all my designs for the last three years. Integrated Aquatic Environments is truly an industry leader incorporating innovative technology and design, allowing integration of all the filtration system components and making them accessible through a user-friendly touch screen controller.

The HALO Controller was developed by Steve Gremer, an expert in filter system design, installation, start-up and trouble shooting. Steve's background in the pool mechanical room trenches has given him a hands-on knowledge of what what needs to be done to maximize the performance and efficiency of the filtration system.

The HALO Controller was specifically designed for regenerative filter systems, optimizing the regenerative cycle from uniform precoats through controlled transitions. However, it does much more than that. The HALO is fully customizable, which I have needed on many projects, and can be used on pressure sand and vacuum filter systems.

Steve is eager to take on difficult mechanical room designs and make the systems run flawlessly. The support provided by Integrated Aquatic Environments, which is rarely needed once in operation, is second-to-none. The HALO Controller has made all my clients happy and has made the entire design team shine. I highly recommend Integrated Aquatic Environments!
